

Control of Substances Hazardous to Health

**Chemical
handling and storage**

Pages 2-11

COSHH

**Introducing a
new range of spill kits**

Page 48

When working with any type of hazardous material, it is essential to handle and store it safely. COSHH - Control of Substances Hazardous to Health - is a legal requirement that means you must have procedures in place to reduce or prevent workers' exposure to hazardous substances.

Know Your Workplace Spills

Workplace spills, leaks and overflows are an unfortunate inevitability in many facilities. Thousands of workplace falls occur each year because of spills, and depending on the liquid in question, just a small amount seeping into drains, waterways or ecosystems can cause environmental damage.

Ensuring that workplace spills are monitored, contained and cleaned up is of paramount importance. Successful workplace spill clean-ups involve understanding the different types of spills that can occur, the best ways to contain those spills, and the products available to combat them.

The three main categories of workplace spills:

Chemical spills involve destructive substances such as acids and bases. These spills require special PPE for handling and clean-up, and they need specific sorbents that can tolerate corrosive chemicals. There is a wide range of chemical PPE available, ranging from chemical-resistant aprons to full body coveralls with boots and jackets. It is important to assess the effects of potential spills and clean-ups ahead of time so the correct PPE can be acquired.

Maintenance spills are water-based solvent and chemical spills. These are the most common spills and are non-aggressive. For these spills, water-absorbent materials and materials that contain cellulose are most useful.

Oil spills consist of hydrophobic hydrocarbons – these are usually leaks of butane, petrol and diesel. As the name suggests, these substances tend to avoid water, and clump together. Thankfully, there are specific products designed especially for oil spills.

Protect staff from hazardous sharps and body fluid incidents.

Chemical Information Guide

Chemical Safety → → → → →
Using chemicals safely can reduce the risks of chemical hazards. You should be familiar with the relevant Health and Safety legislation and receive regular training on the action required during a chemical spill. COSHH data sheets about the chemicals in your workplace should also be available.

Personal Protective Equipment → → → → →
The type of PPE required during a spillage, such as gloves and masks, should be readily available and specific to the chemical hazard. You should also ensure training is received in the use of PPE specific to your workplace risks. Before attending to any casualty the first aider should ensure they are in no danger. This may mean wearing appropriate PPE. The casualty may need to be removed from the chemical hazard before starting your first aid checks i.e. if they have fallen into the chemical or there is a chemical gas leak.

1. Risk Assessment
2. Protective Clothing
3. Containment
4. Stop the Source
5. Begin Clean Up
6. Contact Authorities
7. Disposal of Used Material
8. Decontaminate
9. Restock Materials
10. Review Contingency Plans and Procedures!

What is a substance hazardous to health under COSHH?
Under COSHH there are a range of substances regarded as hazardous to health including: Substances or chemical substances classified as dangerous to health under the chemical hazard information and packaging for hazardous substances (CIPHS) (2009). These substances can be found in many different forms and are used in a wide range of applications. They can be found in many different forms and are used in a wide range of applications.

Know Your Symbols → → → → →
If hazardous symbols, labels and other information, are clearly presented with work, such as labeling, warning labels or notices, or if the response is consistent to the work, it is a hazard to health or safety. It is a hazard to health or safety if the response is consistent to the work, it is a hazard to health or safety. It is a hazard to health or safety if the response is consistent to the work, it is a hazard to health or safety.

What is NOT a substance hazardous to health under COSHH?
The use and storage of a substance classified as dangerous to health under COSHH does not make it a hazard to health or safety. It is a hazard to health or safety if the response is consistent to the work, it is a hazard to health or safety. It is a hazard to health or safety if the response is consistent to the work, it is a hazard to health or safety.

Chemical Spills

Overview
COSHH is a set of regulations that control the use of hazardous substances in the workplace. It is designed to protect people from the risks to their health and safety from hazardous substances. COSHH requires employers to assess the risks from hazardous substances in the workplace and to take measures to control these risks. COSHH also requires employers to provide information and training to their employees about the risks from hazardous substances and the measures to control these risks.

What to do when a spill occurs?
1. Stop the source of the spill.
2. Contain the spill.
3. Clean up the spill.
4. Dispose of the spill.
5. Report the spill.

Oil only spill kits absorb oil and petroleum-based liquids whilst repelling water. Use an oil only spill kit to catch leaks and spills around machines.

Oil

Seton has a range of cost effective spill products to cover different applications

CAS0037OIL From £43.50

Oil Spill Information Guide

When an oil spill occurs → → → → →
If there is a fire or medical attention is needed contact a first aider or call 999. Warn all people nearby and evacuate the area as necessary. Evaluate the toxicity, flammability and other hazardous properties of the liquid from a safe distance. If the spill is flammable or volatile, immediately warn everyone, control all potential ignition sources and isolate the area. Stop the spill at the source (repair leaks, turn off source, plug or patch source).

Personal Protective Equipment → → → → →
The type of PPE required during a spillage, such as gloves and masks, should be readily available and specific to the chemical hazard. You should also ensure training is received in the use of PPE specific to your workplace risks.

1. Risk Assessment
2. Protective Clothing
3. Containment
4. Stop the Source
5. Begin Clean Up
6. Contact Authorities
7. Disposal of Used Material
8. Decontaminate
9. Restock Materials
10. Review Contingency Plans and Procedures!

What is a substance hazardous to health under COSHH? → → → → →
Under COSHH there are a range of substances reported as hazardous to health including substances or mixtures of substances classified as dangerous to health under the European Union Classification and Labelling for Hazardous Substances (CLP). These warning labels are clearly shown and the supplier must provide a safety data sheet to them.

Know Your Symbols → → → → →

What is NOT a substance hazardous to health under COSHH? → → → → →
For the vast majority of commercial substances, the presence or not of a warning label will not indicate whether COSHH is relevant. For example there is no warning label on a common household product like washing up liquid, but it is still a substance that can be harmful to health if it is used in a way that is not intended.
